

Selective massages with Angel Combi Oils

The selective massage is the easiest form of massage. It involves the application, and soft massaging, of an Angel Oil on a certain part of the body. Energy blockages can be quickly dealt with in a gentle way. Children feel, very clearly, on which part of the body they want the oil to be applied.

It is often one of the seven main chakras, a new chakra, or one of the numerous side chakras. In other cases, it could be an important meridian point which the child shows you.

It is not about knowing which point has which meaning and why has the child chosen it. It is more about understanding the message behind the Angel Combi Oil, and the appropriate children's symbol. It gives you a new and wider view of your child's health, and develops a more thorough understanding.

APPLICATION AS FOLLOWS:

Method 1 – selection via the Children's Symbols:

Ask the child which Angel Symbol it likes best, and find out from the table which oil corresponds with this symbol. (see file „Children's Symbols & Angel Combi Oils) There you will find key information concerning the symbol and the oil. Feel what this message wants to tell you about the child, its environment, and its most important references. Then you ask the child on which part of the body it wants the oil to be applied and massaged in. The child should decide whether it wants to do the massage itself or somebody else should do it.

After the massage, you can read the corresponding angel story from the book "Angel Symbols for Children". For accurate application on the spot there is a special dispenser >> order at office@ingridauer.com

Method 2 – selection via the Angel Combi Oils:

If you have two or more Angel Combi Oils to choose from, put them in front of the child. Let the child decide spontaneously which oil it wants to use. After the child has decided for one of the bottles, find from in the table which children's symbol corresponds with the oil, and what message it contains. (see file „Children's Symbols & Angel Combi Oils) Then proceed as described in method 1.
